

Questionnaire for collecting data for the review of the BAT Reference Document (BREF) for the Surface Treatment of Metals and Plastics (the STM BREF)

Final version April 2023

European IPPC Bureau

Commission

Questionnaire

for collecting plant-specific data for the review of the BAT Reference Document (BREF) for the Surface Treatment of Metals and Plastics (STM BREF)

Final version - April 2023

Please read the STM BREF questionnaire User's manual which accompanies this questionnaire and consult the EndNotes sheet of this questionnaire if in doubt during filling in.

This questionnaire is designed for the collection of data for emissions to air and water, noise and odour emissions, consumption of materials, water, energy, generation of waste/by-products, and corresponding contextual information about processes, techniques and monitoring from STM installations falling under the scope of the STM BREF. The quality of the data provided is fundamental for deriving sound BAT conclusions. Therefore, this questionnaire should be filled in carefully and as exhaustively as possible.

The questionnaire consists of the following sheets:

O. Introductory notes
 Installation
 Processes description
 Points of release
 Emissions to air
 Noise & Odour
 Emissions to water
 Water consumption & Discharge
 Energy consumption
 Raw materials & Chemicals
 Residues & Circular economy

11. Industrial symbiosis & Decarbonisation

EndNotes

ATTENTION

Not all sheets are initially visible. Some sheets will appear when data are entered in the respective cells.

This questionnaire was designed with Excel 2016 and many functions have been automated using Excel macros. Please enable the macro

options of Excel before completing the questionnaire.

Macros may only work within the precisely defined structure of the questionnaire provided by the European IPPC Bureau. Therefore, the structure of this questionnaire must not be changed under any circumstances. Please do not:

- fill in a questionnaire version other than the final blank questionnaire template uploaded to BATIS;
- insert, delete, hide, unhide or modify the order or names of worksheets;
- insert, delete, hide, unhide or modify a line or a yellow cell in the worksheets;
- modify the content, the format or any other property of yellow cells;
- insert a value or write text outside white cells;
- modify the format or any property, other than the content, of white cells.

You may

• fill in cells with a white or light red background using the required format (i.e. number, text, date).

Contact person (i.e. the person completing the questionnaire; will only be contacted if further information or clarification is needed):						
Company name:	Volvo Car Belgium NV					
Site name:	Volvo Car Gent					
First name and surname:	Jan Smet					
Job title:	Enviromental Engineer					
E-mail (certified if available):	jan.smet@volvocars.com					
Telephone:	0032 494 46 37 51					
Comments:						

Quality check (to be filled in	Quality check (to be filled in by the Member State's competent authority that verifies the quality of the completed questionnaire):					
Country	Belgium (BE)					
Date of quality check						
(xx/xx/xxxx):	7/2023					
Organisation:	partment of environment and spatial development; VITO					
First name and surname:	éphanie Vandamme and Tim Goelen

E-mail:	phanie.vandamme@vlaanderen.be and tim.goelen@vito.be					
Telephone:	0032496 40 21 93 and 003214 33 52 76					

Only to be used by MS competent authorities | Only for continuous coil activities

Once the questionnaire has been checked by the MS competent authorities, this button may be used to automatically remove all information entered in the light red cells and save a non-confidential version of the questionnaire.

To be filled in by the TWG member(s) from industry giving assistance with completing the questionnaire:					
Industrial organisation:					
Date of completion					
(xx/xx/xxxx):					
First name and surname:					
Job title:					
E-mail:					
Telephone:					

To be filled in by the TWG mer	o be filled in by the TWG member(s) from environmental NGOs giving assistance with completing the questionnaire:					
Environmental NGO:						
Date of completion						
(xx/xx/xxxx)::						
First name and surname:						
Job title:						
E-mail:						
Telephone:						

In the event that you have doubts or difficulties when completing this questionnaire, please contact the European IPPC Bureau,

JRC-B5-EIPPCB-STM@ec.europa.eu

The filled-in questionnaire, together with any additional documents (such as flow diagrams/layouts), should be returned to the contact person in your Member State (i.e. the person who sent you the questionnaire).

INFORMATION ABOUT THIS QUESTIONNAIRE

Industrial Emissions Directive and BREFs

The Industrial Emissions Directive (IED), 2010/75/EU, of 24 November 2010 foresees under Article 13(1) an information exchange to draw up and review Best Available Techniques (BAT) reference documents (BREFs) as the vehicle through which BAT (and emerging techniques) are determined in a transparent manner, based on sound techno-economic information. The key section of a BREF comprises the 'BAT conclusions', which are adopted through a Committee procedure. The 'BAT conclusions' are published as EU Implementing Decisions in the Official Journal of the European Union and provide the reference for setting the permit conditions of installations covered by the IED. Each BREF is the outcome of a 3- to 4-year information exchange process involving numerous experts, representing EU Member States, industry, environmental NGOs, and services of the Commission.

Information exchange under the IED for the review of the STM BREF

Following Commission Implementing Decision 2012/119/EU, the information exchange leading to the drawing up and review of BREFs is organised by the European Integrated Pollution Prevention and Control Bureau (EIPPCB). Located in Seville (Spain), the EIPPCB is part of the Circular Economy and Sustainable Industry Unit of Directorate B - Fair and Sustainable Economy of the European Commission's Joint Research Centre (JRC).

The review of the BREF for the Surface Treatment of Metals and Plastics (STM BREF) officially started with the reactivation of the Technical Working Group (TWG) in June 2021. The Kick-off Meeting of the TWG was held as a series of web-based sessions from 30 May to 7 June 2022; a meeting report is available on the EIPPCB website at: https://eippcb.jrc.ec.europa.eu/reference

All data and information for the review of the STM BREF are exchanged via an electronic BAT information system (BATIS), except for confidential and sensitive information. Only registered members and JRC staff are allowed to submit and view information on BATIS. The BATIS privacy statement can be consulted on the EIPPCB website: http://eippcb.jrc.ec.europa.eu/batis/downloadPdf?name=Privacy_Statement_BATIS__DPO-1586.pdf

The personal data requested about the persons who filled in or checked the questionnaire will only be used so that they can be contacted if questions arise when the EIPPCB analyses the data. Should you have any queries concerning the processing of your personal data, please address them to the secretariat of the Circular Economy and Sustainable Industry Unit: JRC-B5-SECRETARIAT@ec.europa.eu

Purpose of this questionnaire

The purpose of this questionnaire is to collect plant-specific data and information on the environmental performance of installations that are within the scope of the STM BREF (see below). As one of the main information sources for the STM BREF review, the collected data and information will provide the basis to derive the Best Available Technique (BAT) conclusions regarding: 1) emissions to air and water, 2) consumption of materials, water and energy, and 3) generation of waste, waste water and residues. Moreover, the collected data and information will be used to draw up the chapters on 'Current emission levels' and 'Techniques to consider in the determination of BAT' of the STM BREF.

Scope of the revised STM BREF

The activity listed in point 2.6 of Annex I to the IED (surface treatment of metals or plastic materials using an electrolytic or chemical process where the volume of the treatment vats exceeds 30 m³) is in the scope of the STM BREF. Based on the KoM conclusions, the following activities are also included:

• semiconductor manufacturing,

• porcelain/vitreous enamelling of metals,

• on-site combustion processes that either generate hot gases for direct contact heating, drying or any other treatment of objects or materials; or whose radiant and/or conductive heat is transferred to objects or feed material through a solid wall without using an intermediary heat transfer fluid,

• independently operated treatment of waste water not covered by Directive 91/271/EEC (activity listed in point 6.11 of Annex I to the IED) when the main pollutant load originates from the activities within the scope of the STM BREF,

• combined treatment of waste water from different origins provided that the main pollutant load originates from the activities within the scope of the STM BREF and that the waste water treatment is not covered by Directive 91/271/EEC,

• chemical vapour deposition when it occurs as a process step of or as an activity directly associated with the STM activity.

Member States are responsible, with the support of industrial organisations and environmental NGOs, for collecting and checking the filledin questionnaires so that the EIPPCB can have them all returned by the strict deadline of 14 July 2023.

The quality of the data provided is fundamental for deriving sound BAT conclusions. Therefore, this questionnaire should be filled in carefully and as exhaustively as possible.

Type of requested information

Please submit data and information that you have available and/or that you are able to collect. Please provide information and descriptions as well as plant-specific and process-specific data on emissions to air and water, consumption of energy, water and materials, and generation of waste, waste water, and residues. You may attach supporting documents to provide other relevant information together with this questionnaire.

Handling of information considered confidential business information (CBI)

The exchange of information under the Industrial Emissions Directive shall not lead to the breaching of EU and national competition laws or other laws designed to protect legitimate economic interests. The data and information submitted in this questionnaire will be used solely for the purpose of reviewing the STM BREF.

The questionnaire cells marked in red will contain information dealt with as CBI.

The EIPPCB will ensure that confidential business information will not be shared with representatives of undertakings and of trade associations with an economic interest in the industrial activities concerned and related market, in accordance with competition law. The EIPPCB will also ensure that requests for access to confidential business information are handled in accordance with the requirements and limits set out in Regulations (EU) 1049/2001 and (EU) 1367/2006.

The plant operator will:

send the filled-in questionnaire (containing CBI if applicable) to the Member State's competent authority for quality checks;
send any process flow diagram(s) and other supporting documents to the Member State's competent authority; such documents should not contain CBI.

The Member State representative will:

• check the quality, completeness and consistency of the information in the filled-in questionnaire; ask plant operators for clarification or

revisions, if needed;

• create and save a non-confidential version of the questionnaire (without CBI), using the functional button referred to above;

• post the non-confidential version of the questionnaire (without CBI), and any other supporting documents onto BATIS, so that they will be shared with the TWG;

• send the filled-in questionnaire containing CBI to the EIPPCB by email (preferably using encryption).

The EIPPCB will store the questionnaire by:

anonymising the filled-in questionnaire (containing information considered CBI) and allocating a CBI reference number to each installation; this reference will be used to identify the installation whenever CBI is used as part of the data assessment and analysis;
keeping the filled-in questionnaire (containing information considered CBI) and the CBI reference number in access-restricted and password-protected electronic folders; this location will be accessible only to the Head of the EIPPCB and the STM BREF authors for the purpose of reviewing the STM BREF.

Scope of the data collection for emissions to air and to water							
The scope of the data collection covers emissions to air for the following (groups of) substances and parameters:							
TVOC	Sulphur oxidesOdourCadmium and its compoundsTotal acidi			Total acidity	Formaldehyde		
TVOC containing CMR 1 and CMR 2 substances	Dust	Zinc and its compounds	Hexavalent chromium	Lead and its compounds			
Tetrachloroethylene	Gaseous chlorides	Nickel and its compounds	Ammonia	Hydrochloric acid			

Hydrogen cyanide	Hydrochloric acid (HCl)	Chromium and its compounds	Sulphuric acid	Noise			
Nitrogen oxides and carbon monoxide	Gaseous fluorides	Copper and its compounds	Alkalinity	Greenhouse gases (GHGs)			
The scope of the da	The scope of the data collection covers emissions to water for the following (groups of) substances and parameters:						
PFOS	Trichloromethane	Metals	Halogenated organic compounds	Cyanides and free CN	Ammonium nitrate		
PFAS	(OP/OPEOs) – (NP/NPEOs)	Sulphides and organosulphides	Phenols	Total nitrogen	BOD5		
EDTA	Surfactants (other than OP/OPEOs – NP/NPEOs)	TOC and COD	Phosphates and Total P	Parameters proposed as contextual information	Nitrite nitrogen		
Poorly biodegradable complexing agents (other than EDTA)	Acute toxicity / whole effluent toxicity	Fluorides	Chlorides	Suspended Solids & TSS	Silicon		
Hydrocarbon Oil Index

	ENDNOTES
	0. Introductory notes
Contact person (i.e. the person completing the questionnaire; will only be contacted if further information or clarification is needed)	Information on the person completing or checking the questionnaire. This person may be contacted if further information or clarification is needed. This will usually be an employee of the company that is the operator of th installation or a consultant working for the operator of the installation.
	1. Installation
Plant code number for the data collection (from the list of plants proposed to participate in the data collection available on BATIS)	This number is provided to the operator by the competent authority based on the list of participating plants tha is available on BATIS.
Total permitted volume of treatment vats (m3)	Please report the permitted total volume of treatment vats. In addition to the main process vats, vats which are typically used for processes such as soak clean, pickling, degreasing, acid dip and passivation also fall under the definition of treatment vat as all these processes involve an alteration of the surface as a result of an electrolytic or chemical process. This does not apply for the rinsing process.
Total volume of rinsing vats (m3)	Please report the total volume of rinsing vats.
Total permitted production capacity in mass of treated objects per year (t/y)	if available.
Total permitted production capacity in number of treated objects per year (units/y)	Total permitted production capacity in number of treated objects per year (units/y).
Total permitted production capacity in total surface of treated objects per year (m2/y)	Based on the permit data, please report the total production capacity in surface of treated objects per year (in m2/y) if available.
Total permitted production capacity expressed in other unit(s) - please specify in Additional information	In the event that in the permit the production capacity is expressed in a different unit to those proposed in the cells on the left, please report it (with the corresponding unit).
Total volume of workspace (production area) heated (m3)	Please report the total volume of workspace heated (expressed in m3). This heating need may have an influence on the energy consumption of the installation.
Main process ▼	Please select from the drop-down menu the main process or processes. According to your selection, dedicate worksheet(s) will be made visible to fill in the specific information requested for the process description.
Other directly associated activity(ies) (IED or non-IED) carried out at the installation ▼	Select the activities from the drop-down menu and report any other relevant activity carried out at the plant (e. common waste water treatment, STS (surface treatment using organic solvents), etc.
Capacity utilisation (% of maximum capacity - annual average)	Please provide the annual average for the capacity utilisation of the installation as a percentage (100 % = full capacity, no idle time).
Other than normal operating conditions (OTNOC) situations and relevant techniques	Please report in this table information related to pollution originating from incidents and accidents, e.g. fires or explosions, leakages, development of toxic gases/emissions.
Techniques to reduce diffuse (unchannelled) air emissions at plant level	Techniques to reduce the non-channelled emissions to air. Diffuse emissions include fugitive and non-fugitive emissions. Fugitive emissions are non-channelled emissions to air caused by loss of tightness of equipment which is designed or assembled to be tight. Fugitive emissions can arise from: — moving equipment, such as agitators, compressors, pumps, valves (manual and automatic); — static equipment, such as flanges and other connections, open-ended lines, sampling points. Non-fugitive emissions are diffuse emissions other than fugitive emissions. Non-fugitive emissions may arise from, for example, atmospheric vents, bulk storage, loading/unloading systems, vessels and tanks (on opening), open gutters, sampling systems, tank venting, waste, sewers and water treatment plants.
	2A. Plating processes
Line 1	Line is to be understood as a series of vats (tanks) where one or several processes occur. The questionaire allows the submission of information for a maximum number of 10 lines. If more than 10 lines exist in the installation, please report the information for the 10 lines with the greatest environmental impact (in terms of emissions and/or consumption).
Type of core activity per line (1) ▼	In case of doubt, please consult also the Glossary of the current BREF where you can find synonyms of the main terms used.
Number of treatment vats per line ▼	Please report the number of treatment vats per line. For more information and clarification of the term 'treatme vat' see the endnote in worksheet 1 on the 'total volume of treatment vats'
Total volume of treatment vats (m3) per line	Please report the total volume of treatment vats per line. In addition to the main process vats, vats which are
Number of rinsing vats per line ▼	Please report the number of rinsing vats per line.
Total volume of rinsing vats (m3) per line	Please report the total volume of rinsing vats.
Number of rinsing steps ▼	Please report the number of rising steps of the line either for cases where one type of rinsing is carried out, or adding all rinsing steps when several type of rinsing are carried out. Rinsing cascades should be considered a one single rinsing step.
Current density (A/m2) (annual average) ▼ Current efficiency (%) (annual	Please report the value(s) for the workpiece(s) treated.

Geometry of treated workpieces ▼	In general, the geometry of workpieces is a difficult parameter to qualify. Please select from the drop-down menu the option that you believe characterises best the complexity of workpiece shape treated at your installation. For example, lack of cavities, smooth edges and in general geometry that is unfavorable for solution retention may be considered as 'simple shape'. In case of a combination of workpieces with various geometries, please select the option 'various'.
Conductivity of workpiece (mS) -	Please report the conductivity as an average value for all the core activities of the line, and specify whether this
average value for all the core	refers to the conductivity of the core metal or the metallic surface layer. Please specify the method used in
activities of the line	additional information (e.g. Van der Pauw)
Techniques for drag-in reduction	Techniques aiming to reduce the quantity of liquid (from a previous bath) carried into a bath by the workpieces
rechniques for drag-in reduction	or substrate introduced during treatment.
Techniques for drag out reduction	Techniques aiming to reduce the quantity of liquid carried out of a bath by the workpieces or substrate during
Techniques for drag-out reduction	treatment.

<u> </u>	2B. Printed circuit boards
Total quantity of organic solvents	Please report the total quantity of organic solvents that are used in the installation per year expressed in t/y. If
used per year (t/y)	actual consumption data are not available, you may report the solvent consumption capacity per year as stated
	in your environmental permit (if applicable).
Type of PCBs produced ▼	In this and the subsequent cells please report the type(s) of PCB produced in the installation.
Production steps	Please select the production steps that are taking place in the installation.

	2C. Semiconductors
Type of plant ▼	Please select from the drop-down menu the type of plant based on the activities carried out. In general: Fab-lite: in-house semiconductor manufacturing that produces specific low-cost higher technology-nodes that are still in high demand in industries like aerospace, automotive, shipping, defence. Fab-less refers to the installations focussing only on the design of the semiconductor product.
Process node (technology node) produced (nm) ▼	Please select in the cells on the right the corresponding process node(s) for your installation.

	2D. Continuous steel coil
Electrolytic cell geometry (type)▼	Please select from the drop-down list the option that corresponds to the movement of the coil.
Vats temperature (i.e. over/under room temperature) ▼	Please consider the average ambiant temperature of the room.
Current density (A/m2) (annual average) ▼	Please report the value(s) for the workpiece(s) treated.
Current efficiency (%) (annual average) ▼	Please report the value(s) for the workpiece(s) treated.
Conductivity of workpiece (mS)	Please report the conductivity as average value for all the core activities of the line, and specify whether this refers to the conductivity of the core metal or the metallic surface layer. Please specify the method used in additional information (e.g. Van der Pauw)
Techniques for drag-in reduction	Techniques aiming to reduce the quantity of liquid (from a previous bath) carried into a bath by the workpieces or substrate introduced during treatment.
Techniques for drag-out reduction	Techniques aiming to reduce the quantity of liquid carried out of a bath by the workpieces or substrate during treatment.

	2E. Vitreous enamelling
Type of product ▼	Please select from the drop-down menu the type(s) of product for each production line.
Type of process ▼	Please select from the drop-down menu the type(s) of process for each production line.
	3. Points of release
Name of the attached diagram	Please provide here the name of the supporting document (preferably an attached diagram), if available, where
	the configuration of points of release is shown/explained.
Name of the point of release (as	
mentioned in the permit, flow	The point where the emissions leave the installation and where the ELV applies.
diagrams etc.)	
	4. Emissions to air
	In the event that several lines are associated with the same process, please report them by using 1 separate
	row in the table for each line (in column J) and repeating the process (in columns E to I). The same applies for
Process number	the number of vats (in column K): in the event that more than 1 vat is associated for each process, please report
	each vat individually using a single row.
Acid / alkali concentration (g/l)	The concentration refers to the concentration in the process bath, as contextual information.
	According to the decision of the Kick off Meeting, please note that the following on-site combustion processes
	are covered:
	- generation of hot gases for direct contact heating, drying or any other treatment of objects or
Associated process to fuel use ▼	materials; or
	- where radiant and/or conductive heat is transferred to objects or feed material through a solid
	wall without using an intermediary heat transfer fluid.
	If available, please report here the off-gas flow rate for each individual process that discharges off-gases at this
Off-gas flow rate (Nm3/h) from each	
process	same emission point (point of discharge). If there is only one associated process with this emission point, the off-
process of the second s	gas flow rate will be reported in Table 4.2. below.
Additional information/Comments	
(e.g. configurations associated with	The information to be reported in these columns is related to the worksheets 2A, 2B, 2C, 2D or 2E. Please
this point of release)	report any relevant information related to the emissions to air.
Comison ductors records studies (00)	Please note that the purpose of the table is to describe the process steps that are related to the corresponding
Semiconductors manufacturing (SC)	emission point to air. Only relevant information for this sector should be reported in this table.
Gaseous chlorides (as HCI)	Please note that HCI should be excluded here and reported in the cell below.
	Please select from the drop-down menu the reference year (from the period 2022-2012. Data should be
	provided for the most recent 3-year reporting period (e.g. concerning years 2022, 2020 and 2019 if available and
	if representative)). If values are not or not yet available for these years, data from other recent years may be
Reference year ▼	reported. For the selection of the reporting year period, a drop-down menu is provided (which includes the
	period from 2022 to 2011). Please start reporting the requested data with the most recent year period. For
	example if data are available for the year periods 2022, 2019 and 2016 (monitoring once every three years), first
	report the data for 2022, followed by data for 2019 and then for 2016.

O2 content during measurement	The corresponding O2 content in the waste gas flow(s) measured during the reference years. In the event tha the single emissions of parameters in Table 4.4 were monitored separately, please report the corrected O2 reference level for the measurment of the single parameter (see O2 reference level below).
	Please specify by using the drop-down menu. The specified time intervals may be regular (e.g. once every month) or irregular. Measurements are usually made using portable equipment for typically less than 24 h. The data reported here should refer only to the normal operating conditions during the reference year. Although values obtained during other years may also be representative of the current plant operation, please provide only data obtained during the reference year. Since the purpose of this questionnaire is to collect information of plant performance and not on compliance with requirements imposed by the competent authority, please report the shortest term average type which is available at the plant level (e.g. if half hourly averages and daily averages are available, report only half hourly averages, regardless of what is actually reported to the competent authority).
Sampling period (h)	Indicate the duration of each sample related to the values reported for discontinuous measurements. For example if the reported value corresponds to the average value of three consecutive measurements of 30 minutes each, please report 1.5 hours.
Minimum value of the measurements taken during the reference year (or indicate if not applicable)	If the measured value is below the detection and/or quantification limit, report the detection and/or quantificati limit of the measurement method (without using the symbol "<") and give information in the corresponding additional information column (last column).
taken during the reference year (or	Please indicate values derived as the arithmetic mean of all the values of short-term and long term averages obtained during the reference years (excluding, if possible, data referring to other than normal operating conditions, as well as periods when the plant was not operational).
Maximum value of the measurements taken during the reference year	If the measured value is below the detection and/or quantification limit, report the detection and/or quantificati limit of the measurement method (without using the symbol "<") and give information in the corresponding additional information column (last column).
95th percentile of the measurements taken during the reference year (or indicate if not applicable)	As part of the validation procedure, the outliers (defined as results which deviate significantly from the other values in a measurement series) should be excluded before reporting the 95th percentiles. Furthermore, since the data reported here should refer only to normal operating conditions, any data referring to other than normal operating conditions, as well as periods when the plant was not operational, should be excluded if possible. If the measured value is below the detection limit report the detection limit of the measurement method in the additional information cell.
	For the given pollutant/parameter, please provide the overall removal efficiency of all combined waste gas treatment units (applied techniques as reported in Table 4.1.2 above). If the waste gas treatment system is on made up of one step (e.g. one technique applied), then report the efficiency of this step. Please specify in additional information how the removal efficiency has been obtained (e.g. desing value, measuremend, calculated or estimated).
O2 reference level (vol-%) for the reported emission levels	In the event of emissions from combustion processes, please report the Reference O2 percentage (dry basis considered for the reported concentration values, i.e. if reported values have been corrected to a reference O level different to than this of the measurement (see O2 content above). Please, see also Section 3.5 of the User's Manual.
Standard monitoring method ▼	The published or documented procedure for using the monitoring approach and technique (i.e. analytical principle, such as infrared absorption, chemiluminescence, isokinetic sampling followed by gravimetry, sorbe tube followed by gas chromatography), so that comparable results can be obtained when the monitoring is carried out at different times or by different organisations. Please select, from a drop-down list, the appropriat CEN, ISO or other standard. For further information on monitoring methods see the JRC Reference Report o Monitoring of emissions from IED installations (the ROM) (Published version 07/2018) at eippcb.jrc.ec.europa.eu/reference. In the event of parameters with no EN standard available, no drop-down list provided; please fill in the monitoring standard in use. It is highly recommended to report the standard monitoring method used.
Measurement uncertainty (expressed in the same unit as the measured value)	Standard uncertainty as specified in the measurement report. The standard uncertainty is the result of a measurement expressed as a standard deviation (see ISO 20988:2007).
	The limit of detection is the lowest concentration at which the presence of the substance can be confirmed. S a substance is not detected it may be absent or it may be present at a concentration below the limit of detecti If the measured value is below the detection limit, then the detection limit of the monitoring method should be reported.
	The limit of quantification is the lowest concentration at which the amount of a substance can be determined with an acceptable level of accuracy and precision. The limit of quantification will always be equal to or higher than the limit of detection. If the measured value is below the quantification limit, then the quantification limit of the monitoring method should be reported.
	Please report the emission limit values (ELVs) as set in your permit. In this cell, please report the ELVs as a concentration. For ELVs expressed as mass flow please report them in the respective cell on the right.
Averaging period for ELVs ▼	Please select from the drop-down menu the averaging period for the emission limit value as stated in your permit.
Purpose of monitoring ▼	Please select the reason for monitoring the substance: e.g. compliance monitoring, operator self-monitoring, operational control, Other regulation (e.g. health and safety).
Emission load (kg/h)	Please provide data on the emission load (expressed in kg/h) for the given pollutant/parameter. The method calculation of the emission load value reported would be reported in the cell on the right.
How the emission load is calculated	Please provide information on the methodology used for the emission load calculation. For example, which emission concentration value was taken into account (maximum, avergae, minimum), which off-gases flow raws taken into account etc.
Emission limit value (ELV) in the permit as load (in kg/h)	In the event that there is in the IED permit an emission limit value (ELV) expressed as a load, please report th value. The associated averaging period may be reported in the cell for additional information on the right.
Processes/sources of noise ▼	5. Noise & Odour Any noise sources from inside or outside the building should be reported, as long as they are related to the S activities and that their impact for the environment is considered significant (e.g permitting conditions or
	nuisance for the neighbourhood). Any odour sources should be reported, as long as they are related to the STM activities and that their impact the environment is considered significant (e.g permitting conditions or nuisance for the neighbourhood).
In the event of combined treatment, proportion of waste water from the	6. Emissions to water In the event of combined treatment of waste water coming from various processes, i.e. waste water resulting from the STM activity and other(s) non-STM activities, please report the origin of the other (non-STM) acitiviti with special reference to the main pollutants/parameters present in those. More information can be also adde

Type of discharge ▼	The two types of discharge/release are: i) direct (the treated effluent is released to the water body - surface or underground) ii) indirect (the pre-treated effluent is released to the sewage leading to the downstream waste water treatment plant which treats the effluent before releasing it to the water body - surface or underground) No discharge means no direct or indirect release into the environment (e.g. all the water is recycled).
Associated processes with this	Please provide information about all the associated processes related to the point of release.
point of release ▼ Reference year ▼	Please select from the dropdown menu the reference year (from the period 2022-2012. Data should be provide for the most recent 3-year reporting period (e.g. concerning years 2022, 2020 and 2019 if available and if representative). If values are not or not yet available for these years, data from other recent years may be reported. For the selection of the reporting year period, a drop-down menu is provided (which includes the period from 2022 to 2011). Please start reporting the requested data with the most recent year period. For example if data are available for the year periods 2022, 2019 and 2016 (monitoring once every three years), fir report the data for 2022, followed by data for 2019 and then for 2016.
Abatement technique ▼	Please list here the abatement techniques applied to the waste water stream.
Frequency of measurement ▼	Please specify by using the drop-down menu. The specified time intervals may be regular (e.g. once every month) or irregular. Measurements are usually made using portable equipment for typically less than 24 h. The data reported here should refer only to the normal operating conditions during the reference year. Although values obtained during other years may also be representative of the current plant operation, please provide only data obtained during the reference year. Since the purpose of this questionnaire is to collect information of plant performance and not on compliance with requirements imposed by the competent authority, please report the shortest term average type which is available at the plant level (e.g. if half hourly averages and daily averages are available, report only half hourly averages, regardless of what is actually reported to the competent authority).
Minimum value of the measurements taken during the reference year	If the measured value is below the detection and/or quantification limit, as a minimum, report the detection and/or quantification limit of the measurement method (without using the symbol "<") and give information in the corresponding additional information column (last column).
Average value of the measurements taken during the reference year	Please indicate values derived as the arithmetic mean of all the values of short-term and long term averages obtained during the reference years (excluding, if possible, data referring to other than normal operating conditions, as well as periods when the plant was not operational).
Maximum value of the measurements taken during the reference year	If the measured value is below the detection and/or quantification limit, as a minimum, report the detection and/or quantification limit of the measurement method (without using the symbol "<") and give information in the corresponding additional information column (last column).
95th percentile of the measurements taken during the reference year (or indicate if not applicable)	As part of the validation procedure, the outliers (defined as results which deviate significantly from the other values in a measurement series) should be excluded before reporting the 95th percentiles. Furthermore, since the data reported here should refer only to normal operating conditions, any data referring to other than normal operating conditions, as well as periods when the plant was not operational, should be excluded if possible. If the measured value is below the detection limit report the detection limit of the measurement method in the Additional Information cell.
Average removal efficiency (%)	For the given pollutant/parameter, please provide the overall removal efficiency of all combined waste gas treatment units (applied techniques as reported in Table 4.1.2 above). If the waste gas treatment system is on made up of one step (e.g. one technique applied), then report the efficiency of this step. Please specify in additional information how the removal efficiency has been obtained (e.g. desing value, measuremend, calculated or estimated).
Standard monitoring method ▼	Please select from the drop-down menu the appropriate EN, ISO or other standard. For parameters with no standard available, there is no drop-down list provided. Please indicate the monitoring standard used and explain under 'Additional information' for example the analytical principle (e.g. infrared absorption, chemiluminescence, isokinetic sampling followed by gravimetry, sorbent tube followed by gas chromatography It is highly recommended to report a monitoring method. For further information on monitoring methods, see the JRC Reference Report on Monitoring of emissions from IED installations (ROM), available at: eippcb.jrc.ec.europa.eu/reference. For PFAS, please specify if a global measurement method is used, e.g. AOF (Adsorbable Organic Fluorine), EOF (Extractable Organic Fluorine) or TOP (Total Oxidizable Precursors).
Measurement uncertainty (expressed in the same unit as the measured value)	Standard uncertainty as specified in the measurement report.
Limit of detection	The limit of detection is the lowest concentration at which the presence of the substance can be confirmed. So a substance is not detected it may be absent or it may be present at a concentration below the limit of detection If the measured value is below the detection limit, then the detection limit of the monitoring method should be reported.
Limit of quantification	The limit of quantification is the lowest concentration at which the amount of a substance can be determined with an acceptable level of accuracy and precision. The limit of quantification will always be equal to or higher than the limit of detection. If the measured value is below the quantification limit, then the quantification limit of the monitoring method should be reported.
Emission limit value (ELV) in the permit (in mg/Nm3)	Please report the emission limit values (ELVs) as set in your permit. In this cell, please report the ELVs as concentration. For ELV expressed as mass flow please report it in the respective cell on the right. Please select from the dropdown menu the averaging period for the emission limit value as stated into your
Averaging period for ELVs ▼	permit.
Purpose of monitoring ▼	Please select the reason for monitoring the substance: e.g. compliance monitoring, operator self-monitoring, operational control, Other regulation (e.g. health and safety).
Emission load (kg/h)	Please provide data on the emission load (expressed in kg/h) for the given pollutant/parameter. The way of calculation of the emision load value reported would be reported in the cell on the right.
How is the specific emission load calculated (e.g. using average/max or min values)	If data on specific emission loads are reported, please provide information on how the emission load is calculated (e.g. using average, max or min values).

	Per- and polyfluoroalkyl substances (PEASs) defined as any substance that contains at least one fully
	Per- and polyfluoroalkyl substances (PFASs) defined as: any substance that contains at least one fully fluorinated methyl (CF3) or methylene (CF2) carbon atom (without any H/Cl/Br/l attached to it).
Per- and poly-fluoroalkyl substances (PFAS), including PFOS (please specify the measured compound(s) in additional information)	 N-Akyl perfluoroakane sulronamides 1-Alkanesulfonamide, N,N'-[phosphonicobis(oxy- 2,1,ethanediyl)]bis[perfluoro-N-methyl)] Fluorinated (meth)acrylate polymers Potassium perfluorohexane-1-sulponate Potassium undecafluorocyclohexanesulphonate 1-Propanaminium, 3-[[(perfluoroalkyl)sulfonyl]amino]-N,N,N-trimethyl-, chloride (1:1) 1-Propanaminium, N-ethyl-3-[[(perfluoroalkyl)sulfonyl]amino]- N,N-dimethyl-, ethyl sulfate (1:1) N-[3-(Dimethylamino)propyl]-N-[(perfluoroalkyl)sulfonyl]-β- alanine Cyclohexanecarboxamide, N-[3-(dimethyl amino)propyl]-1,2,2,3,3,4,4,5,5,6,6-undecafluoro- 1-Propanaminium, N-(2-carboxyethyl)-N,N-dimethyl-3- [[(1,2,2,3,3,4,4,5,5,6,6-undecafluoro- 1-Propanaminium, N-(2-carboxyethyl)-3-[[[1,2,2,3,3,4,5,5,6, 6- decafluoro-4- (trifluoromethyl)cyclohexyl]carbonyl] amino]-N,N-dimethyl-, inner salt Poly(oxy-1,2-ethanediyl), α-[2-[ethyl]((perfluoroalkyl) sulfonyl]amino]ethyl]-ω-hydroxy N-(2,3-dihydro-2-oxo-1H-benzimidazol-5-yl)-3-oxo-2-[[2- (trifluoromethyl)phenyl]azo] butyramide
Octylphenols and Octylphenol ethoxylates (OP/OPEOs) (please specify the measured compound(s) in additional information)	- 3,3'-[(2-chloro-5-methyl-p-phenylene)bis[imino(1-acetyl-2- oxoethylene)azo]]bis[4-chloro-N-[2-(4- 4-ter octylphenols (ramified) (CAS 140-66-9) ethoxylates OP1EO (CAS number= 2315-65-5)/ OP2EO. other
Nonylphenols and Nonylphenol ethoxylates (NP/NPEOs) (please specify the measured compound(s) in additional information)	4-Nonylphenols (ramified) (CAS: 104-40-5) ethoxylates NP1EO (CAS numbers= 27986-36-3 and 104-35-8), NP2EO (20427-84-3 4 and 27176-93-8 and 156609-10-8) other
Toxicity (if other unit, please specify in additional information)	Please specify the unit (if different) and report the combination of tests carried out, as toxicity can be measured trough different methods.
Any other parameter	Please report the exact CAS number for the substance/parameter in the additional information.
	7. Water consump. & discharge
The data reported in this sheet correspond to the net fresh water consumption of the installation (i.e. excluding recycled/reused water, once-through cooling water and water for domestic-type usage)	Option 1: Report the overall water consumption in the cell additional information and add a note that the reporte data include water quantities used for domestic-type uses. Option 2: Make a calculation for the deduction of domestic-type usages of water from the overall quantity (there are various methodologies and studies available, a safe approximation could be the quantity of 60 litres per day per employee).
Reference year ▼	Data should be provided for the 3 most recent years (e.g. 2022, 2021 and 2020 if available and representative). If values are not yet available or representative for these years, data from other recent years may be reported. For the selection of the reporting year, a drop-down menu is provided (which includes the period 2012-2022). Please report data starting with the most recent year (e.g. first 2022, then 2021 and 2020).
Specific net (fresh) water consumption (m3/m2)	"Specific net (fresh) water consumption" is calculated as the ratio of the total net (fresh) water consumption (m ³) to the total amount (or surface, or volume) of product treated (or m ³ /m ² per gross final surface for PCBs manufacturing) in a reference year.
Sources of water ▼	Please provide information about all the waste water sources related to the point of release. Select multiple waste water sources if the discharge is connected to the same emission point.
	In the event that data are available, please report the total specific net (fresh) water consumption together for the process steps listed. In the event that data are aggregated for an entire process line please report the data
Process or process step	and specify the corresponding number of the line (as reported in worksheet 2) in additional information.
Process or process step Do you operate a closed-loop recycling system of process/waste waters (yes/no) ▼ How is the waste water discharge	Closed loop minimises waste water discharge. It is not zero discharge: there may be small discharges from the treatment processes and process water circuits. Please describe the main characteristics of the system used

	8. Energy consumption
In case of on-site energy production	Please note that steam produced on-site from natural gas should not be considered as on-site energy production.
Reference year ▼	Data should be provided for the 3 most recent years (e.g. 2022, 2021 and 2020 if available and representative). If values are not yet available or representative for these years, data from other recent years may be reported. For the selection of the reporting year, a drop-down menu is provided (which includes the period 2012-2022). Please report data starting with the most recent year (e.g. first 2022, then 2021 and 2020).
Specific net energy consumption (kWh/t)	The energy consumed by the STM process (including electricity and heat; kWh) divided by the amount (or surface, or volume) of product treated in a reference year. 'Net' energy means that energy which is generated on site but used elsewhere (e.g. heat sent to another installation) needs to be subtracted and energy which is generated elsewhere but used on site needs to be added.
	Please note that: Specific net energy consumption = Specific net electricity consumption + Specific net energy consumption from fuels.
Specific net electricity consumption (kWh/t)	The electricity consumed by the process (kWh) divided by the amount (or surface) of product treated during the reference year. Net electricity consumption includes auto-produced electricity.

Specific net heat (e.g. steam) consumption (kWh/t)	The heat consumed by the process (kWh) divided by the amount (or surface) of product treated during the reference year. Net heat consumption includes all kinds of heat (e.g. steam, hot water).
i /	In the event that data are available, please report the total specific net energy/electricity/heat consumption
Process	together for the process steps listed. In the event that the data are aggregated for an entire process line pleas report the data and specify the corresponding number of the line (as reported in worksheet 2) in additional
	information.
	9. Raw materials & Chemicals
Consumption of hazardous substances/chemicals	Report here any relevant chemicals used in the STM processes or any directly associated activities.
	Consumption should be derived from the amount of product purchased multiplied by the concentration (or
Specific consumption of the hazardous substance/compound	maximum concentration in case of a range of concentrations) of the chemical in the product and reported in t relevant unit. In the event that several products containing the same substance are used the consumption
	should be summed up.
CAS number (exact substance or	If there is more than one CAS, list all of them separated by ; (e.g. 91728-14-2; 7429-90-5; 1344-28-1).
compound used)	
Tetrachloroethylene (PER)	CAS Number(s): 127-18-4

Residues & Circular eco.

Rate (in % referring to the same unit as reported in the generation of residues)	Reuse: any operation by which products or components that are not waste are used again for the same purpos for which they were conceived. Recycling: any operation by which waste materials are reprocessed into products, materials or substances whether for the original or other purposes. Residue materials are reprocessed into products, materials or substances for other purposes. Residues used for the same purpose for which they were conceived should be considered under re-use. Recycling excludes energy recovery and the reprocessing of waste/residues into materials that are to be used as fuels or for backfilling operations. Recovery: any operation the principal result of which is waste serving a useful purpose by replacing other materials which would otherwise have been used to fulfil a particular function, or waste being prepared to fulfil that function, in the plant or in the wider economy. Disposal: any operation which is not recovery even where the operation has as a secondary consequence the reclamation of substances or energy.
Process generating waste/residues	In the event that both STM and non-STM processes are carried out generally with a common treatment plant from which wastes are generated, please report only data relevant for STM processes, or indicate the type of activities contributing to the generation of residues.
	11. Ind. symbiosis & Decarbon.
Quality requirement	Please specify any criteria/particularities considered in order to use the input, e.g.: minimum available quantity, number of possible providers, maximum % of impurities, distance for transportation.
Is there any activity carried out related to Annex I to Directive 2003/87/EC, as referred in Article 9.1. in Directive 2010/75/EU	Article 9.1. in Directive 2010/75/EU states: "Where emissions of a greenhouse gas from an installation are specified in Annex I to Directive 2003/87/EC in relation to an activity carried out in that installation, the permit shall not include an emission limit value for direc emissions of that gas, unless necessary to ensure that no significant local pollution is caused." See drop-down menu for the activities specified in Annex I to Directive 2003/87/EC.
